

Prof. Seungchul Lee Industrial AI Lab.

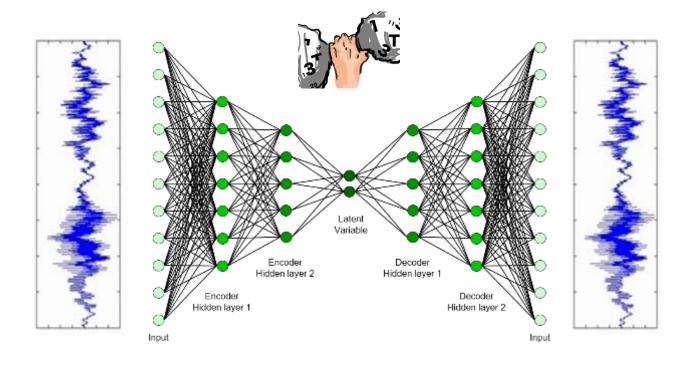

- It is like 'deep learning version' of unsupervised learning
- Definition
  - An autoencoder is a neural network that is trained to attempt to copy its input to its output
  - The network consists of two parts: an encoder and a decoder that produce a reconstruction
- Encoder and Decoder
  - Encoder function : z = f(x)
  - Decoder function : x = g(z)
  - We learn to set g(f(x)) = x

- Dimension reduction
- Recover the input data

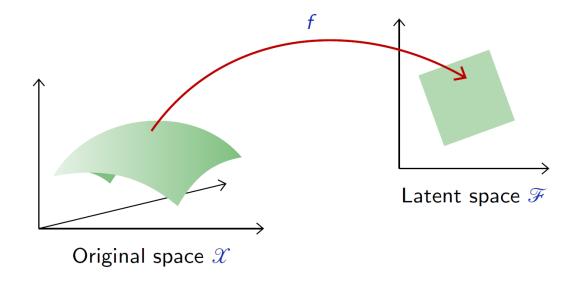

- Dimension reduction
- Recover the input data
  - Learns an encoding of the inputs so as to recover the original input from the encodings as well as possible

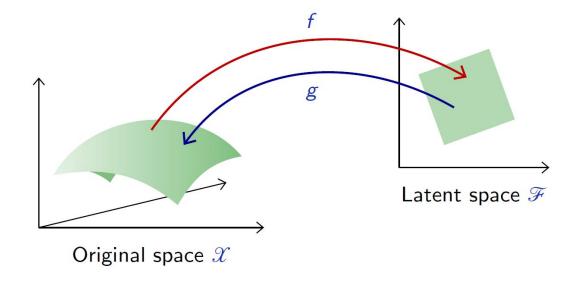

• Autoencoder combines an encoder f from the original space  $\mathcal{X}$  to a latent space  $\mathcal{F}$ , and a decoder g to map back to  $\mathcal{X}$ , such that  $g \circ f$  is [close to] the identity on the data

• Autoencoder combines an encoder f from the original space  $\mathcal{X}$  to a latent space  $\mathcal{F}$ , and a decoder g to map back to  $\mathcal{X}$ , such that  $g \circ f$  is [close to] the identity on the data

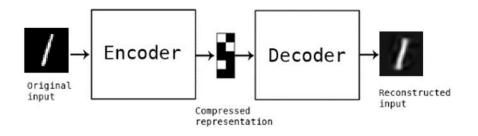

• A proper autoencoder has to capture a "good" parametrization of the signal, and in particular the statistical dependencies between the signal components.

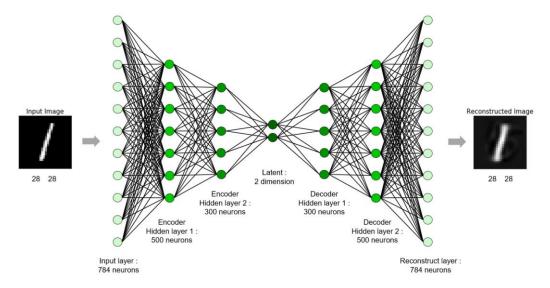

# **Autoencoder with MNIST**

#### **Autoencoder with TensorFlow**

- MNIST example
- Use only (1, 5, 6) digits to visualize in 2-D

$$rac{1}{m}\sum_{i=1}^m (t_i-y_i)^2$$

#### **Import Libraries and Load MNIST Data**

```
import numpy as np
import matplotlib.pyplot as plt
%matplotlib inline

from sklearn.neural_network import MLPRegressor
from sklearn.metrics import accuracy_score
```

• Only use (1, 5, 6) digits to visualize latent space in 2-D

```
train_x = np.load('./data_files/mnist_train_images.npy')
train_y = np.load('./data_files/mnist_train_labels.npy')
test_x = np.load('./data_files/mnist_test_images.npy')
test_y = np.load('./data_files/mnist_test_labels.npy')

n_train = train_x.shape[0]
n_test = test_x.shape[0]

print ("The number of training images : {}, shape : {}".format(n_train, train_x.shape))
print ("The number of testing images : {}, shape : {}".format(n_test, test_x.shape))
The number of training images : 16583 shape : (16583 784)
```

The number of training images : 16583, shape : (16583, 784) The number of testing images : 2985, shape : (2985, 784)

#### **Structure of Autoencoder**

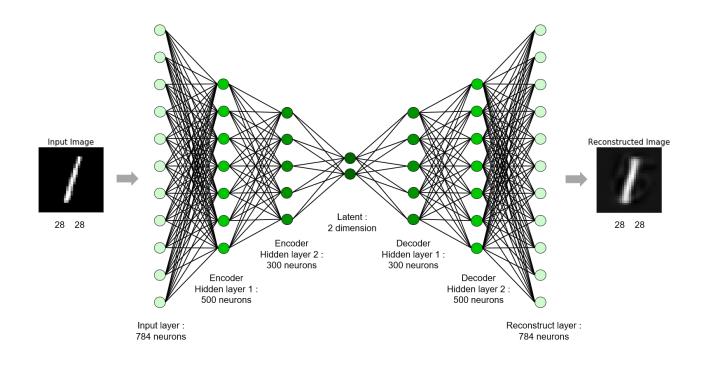

- Input shape and latent variable shape
- Encoder shape
- Decoder shape

```
# Shape of input and latent variable
n_input = 28*28

# Encoder structure
n_encoder1 = 500
n_encoder2 = 300

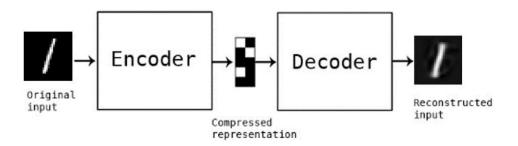

n_latent = 2

# Decoder structure
n_decoder2 = 300
n_decoder1 = 500
```

#### **Build a Model**

#### **Test or Evaluation**

```
idx = np.random.randint(test_x.shape[0])
x_reconst = reg.predict(test_x[idx].reshape(-1,784))
```

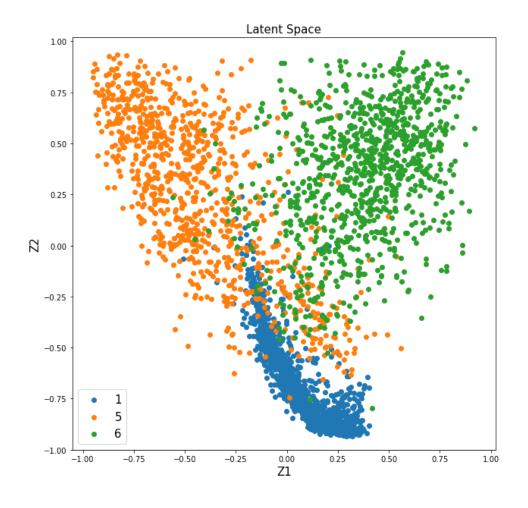

# **Distribution in Latent Space**

• Make a projection of 784-dim image onto 2-dim latent space

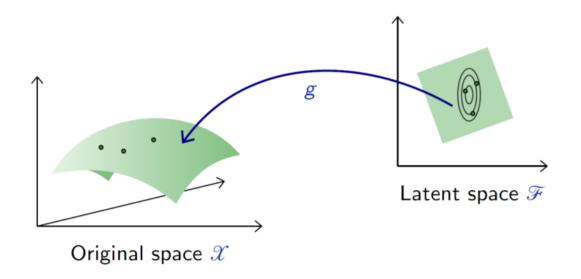

## **Autoencoder as Generative Model**

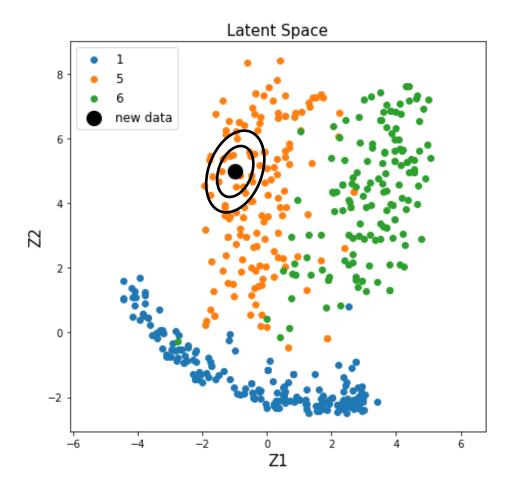

# **Generative Capabilities**

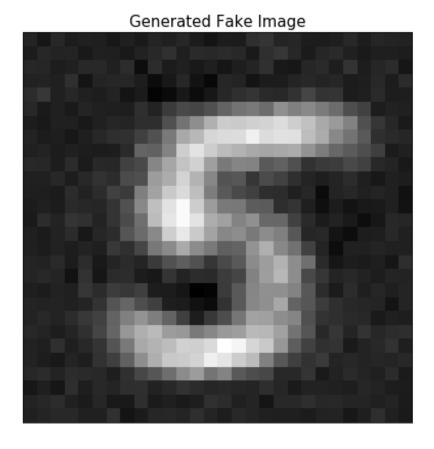

• We can assess the generative capabilities of the decoder g by introducing a [simple] density model  $q^Z$  over the latent space  $\mathcal{F}$ , sample there, and map the samples into the image space  $\mathcal{X}$  with g.

# **MNIST Example**

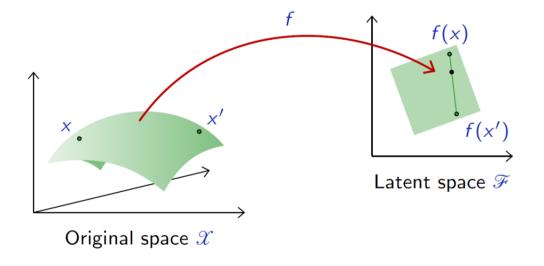

## **Latent Representation**

• To get an intuition of the latent representation, we can pick two samples x and x' at random and interpolate samples along the line in the latent space

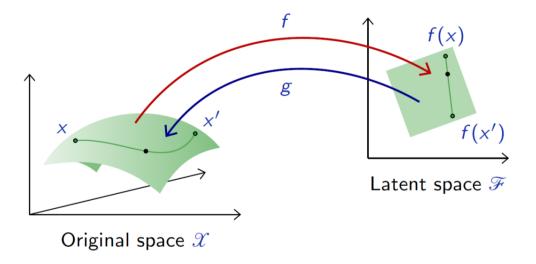

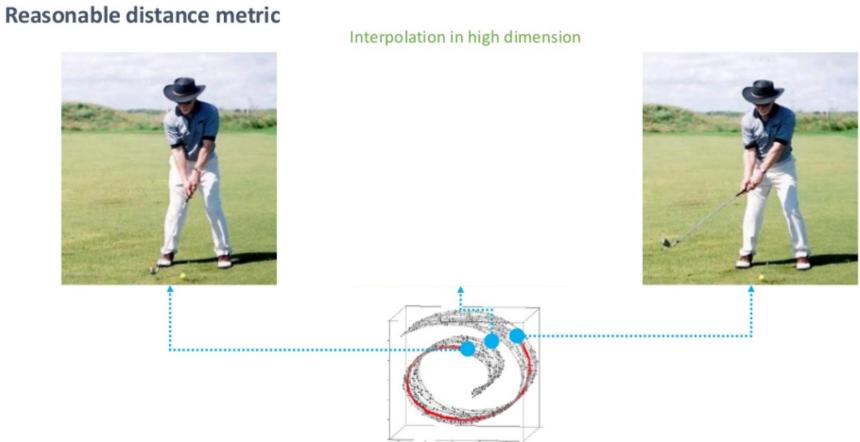

## **Latent Representation**

• To get an intuition of the latent representation, we can pick two samples x and x' at random and interpolate samples along the line in the latent space

$$g\left((1-lpha)f(x)+lpha f(x')
ight)$$

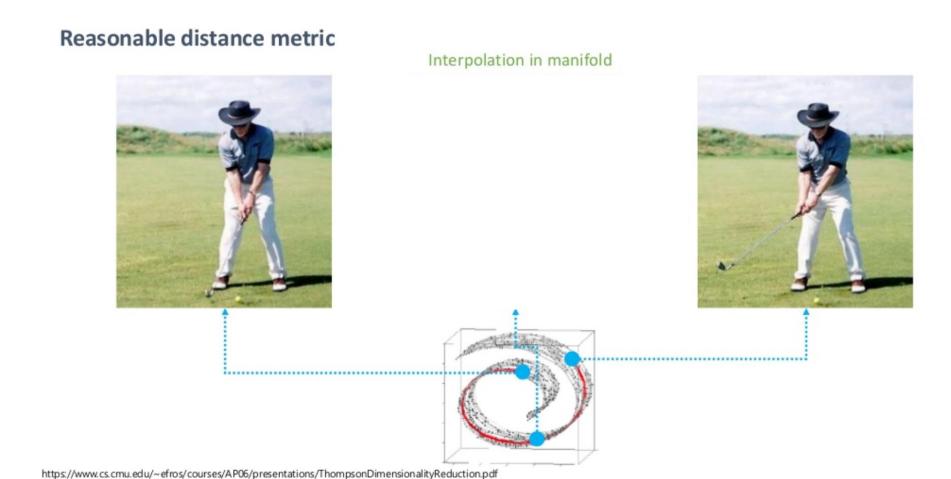

# **Interpolation in High Dimension**

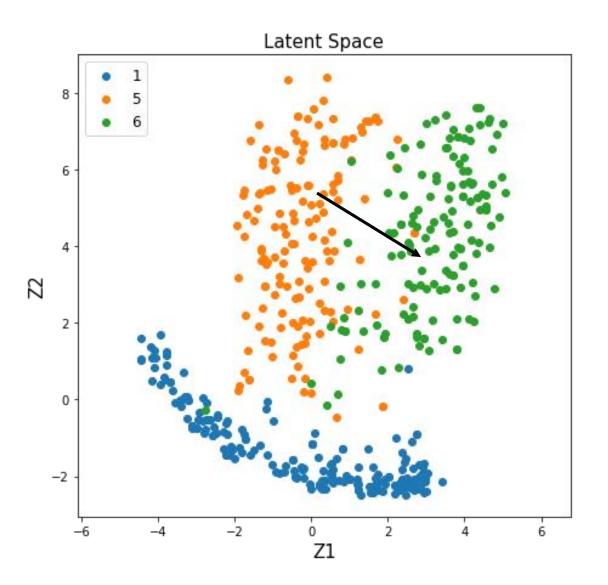

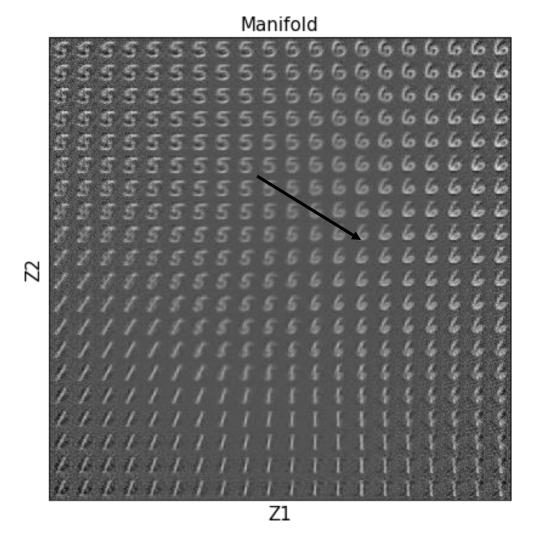

# **Interpolation in Manifold**

## **MNIST Example: Walk in the Latent Space**

## **Generative Models**

- It generates something that makes sense.
- These results are unsatisfying, because the density model used on the latent space  ${\mathcal F}$  is too simple and inadequate.
- Building a "good" model amounts to our original problem of modeling an empirical distribution, although it may now be in a lower dimension space.
- This is a motivation to VAE or GAN.
